SUPERMARKET SALES ANALYSIS DASHBOARD

Project Documentation

Project type: Excel-based sales analysis and dashboard

Dataset: BlinkIT Grocery Data

Tools: Microsoft Excel, Excel Tables, PivotTables, PivotCharts and charts

1. Introduction

This project analyses grocery sales data and presents the results through an Excel dashboard. The workbook organises source records, summarises sales with PivotTables and communicates comparisons through charts.

2. Objectives

Review overall sales performance; compare sales across product categories, outlet types and outlet location tiers; examine sales contribution by item fat content; compare average sales by category; explore item visibility versus sales; and present the findings in a readable dashboard.

3. Dataset Description

The project uses the supplied BlinkIT Grocery Data worksheet. Fields used include Item Type, Sales, Outlet Type, Outlet Location Type, Item Fat Content and Item Visibility. All calculated results should be taken from the supplied workbook; this document does not introduce sales figures.

4. Workbook Organisation

BlinkIT Grocery Data: source records. Pivot_Analysis: total sales by item type. KPI_Summary: key performance indicator summary. Charts: individual visualisations. Dashboard: consolidated presentation.

5. Analysis and Visualisations

Total Sales by Product Category: horizontal bar chart comparing total sales by item category.

Total Sales by Outlet Type: clustered column chart comparing sales across outlet types.

Total Sales by Outlet Location: clustered column chart comparing sales across outlet location tiers.

Sales by Fat Content: doughnut chart showing contribution by fat-content group.

Average Sales by Product Category: horizontal bar chart comparing average sales by item category.

Product Visibility vs Sales: scatter chart with Item Visibility on the X-axis and Sales on the Y-axis; each point represents a source record.

6. Key Performance Indicators

The dashboard may include total sales, average sales, average item visibility, record count and top-four category share where these calculations are present in the workbook. Read KPI values directly from the latest refreshed workbook.

7. Methodology

1. Convert the source range into an Excel Table. 2. Create PivotTables for sales by item type, outlet type, outlet location and fat content. 3. Create a separate average-sales summary using Average as the Sales value calculation. 4. Build PivotCharts from the summaries. 5. Copy Item Visibility and Sales into adjacent helper columns for the scatter chart if needed. 6. Add chart titles, data labels and axis titles where appropriate. 7. Arrange charts and KPI

summaries on the Dashboard sheet.

8. Data Quality and Limitations

Fat-content labels may contain inconsistent abbreviations or capitalisation. Standardise labels (for example, LF/Low Fat and reg/Regular) before refreshing the related PivotTable. The scatter chart can show an association but cannot prove causation. The supplied dataset does not contain a usable transaction date for monthly trend analysis in this project. Results depend on the source data and successful PivotTable refreshes.

9. How to Use and Refresh

Open the workbook in Excel. If source data changes, use Data or PivotTable Analyze → Refresh All, or right-click an individual PivotTable and choose Refresh. Check that summaries and charts reflect the updated source, then review the Dashboard sheet.

10. Conclusion

The dashboard provides a structured view of grocery sales across product categories and outlet dimensions. Its charts support comparisons of total sales, average sales, fat-content contribution and item visibility versus sales. The workbook can be extended with further measures or interactive controls as required.
